# A New Research Initiative at CMU-SV

- ❖ Research Vision:  
“Distilling Human Mobility Data into Valued Services for Societal Good”
- ❖ Research Horizon:  

1-2 years      2-3 years      3-5 years      5-10 years

Industry product roadmap      Industry R&D      Nearer-term academia research      Longer-term academia research
- ❖ Research Approach:
  - ❖ In-situ deployment of end-to-end experimental systems
- ❖ Research Theme:
  - Human mobility data from industry partners
  - Behavior models and predictive intelligence
  - Services for mobile users, communities, and enterprises

# Human Mobility Analytics and Services Systems

## Data from diverse sensing platforms:

- Human sensing
- Vehicle sensing
- Environment sensing
- Infrastructure sensing

## Behavior models and predictive intelligence:

- Mobile population
- Connected vehicles
- Transportation systems
- Wireless networks

## Diverse forms of useful & specialized services:

- Mobile users services
- Public services and policy management
- Enterprise business intelligence

# “Human Mobility Analytics and Services: Insights from a Ride-Sharing Service”

**John Paul Shen & Abhinav Jauhri**

ECE Department, CMU (Silicon Valley Campus)

November 17, 2016 (Traffic21 Seminar)

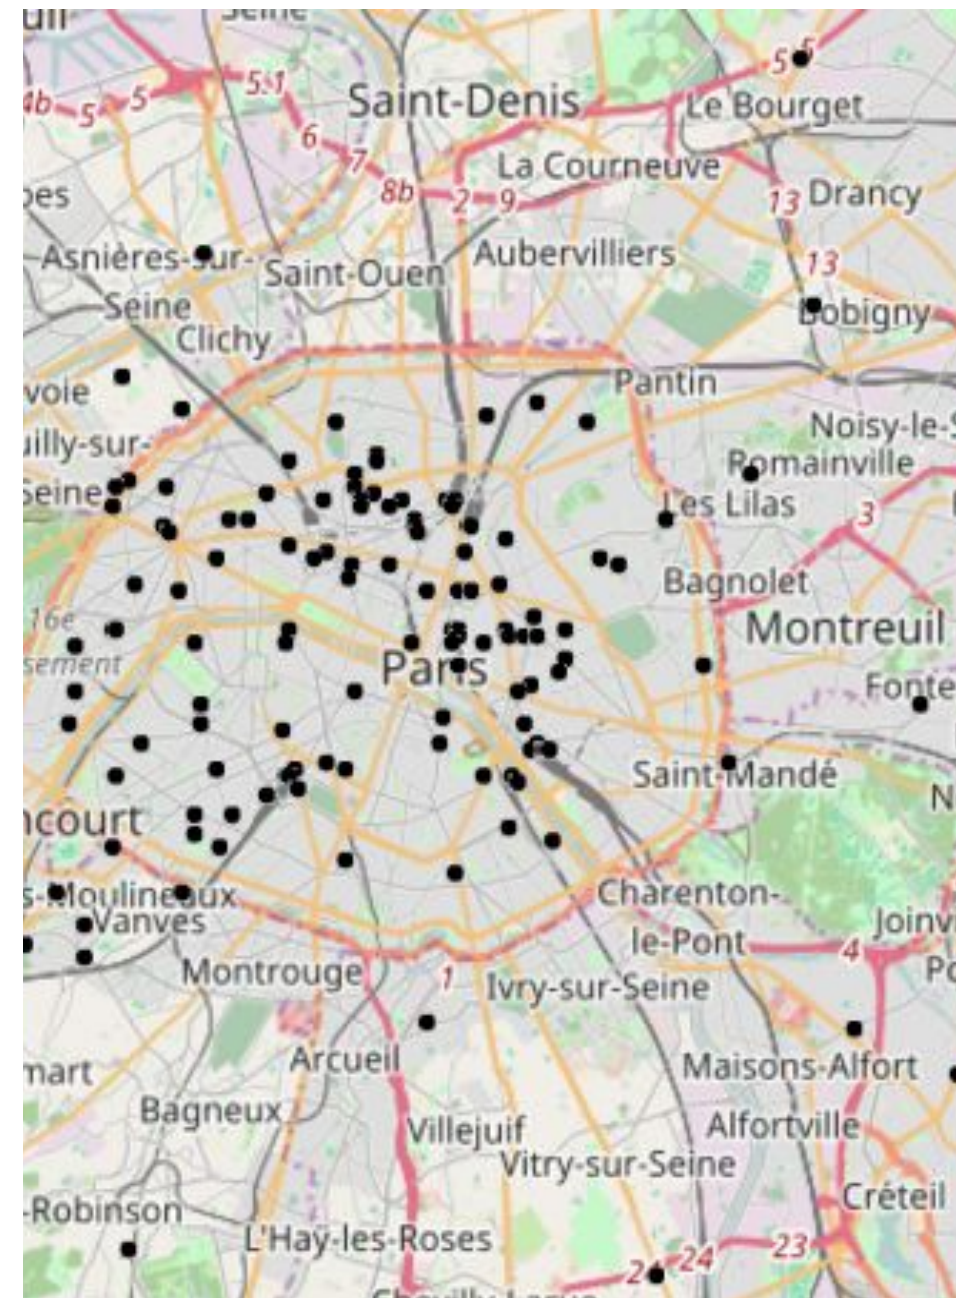

## ABSTRACT:

This talk presents some initial results and insights from our collaboration with a global ride sharing service company. Through this collaboration we have access to ride request data from 400+ cities in the world. We focused on ride requests from the top 40 cities and developed a space-time graph model that captures the spatial and temporal variations of ride requests in a city. Based on this graph model, we can characterize the “*poolability*” of a city (i.e. the % of ride requests that can be pooled). Many cities exhibit potential poolability in the 30% range. We are developing a ride pooling algorithm that can exploit this potential, with the goal of reducing the number of vehicles on the roads and potentially alleviating city traffic congestions.

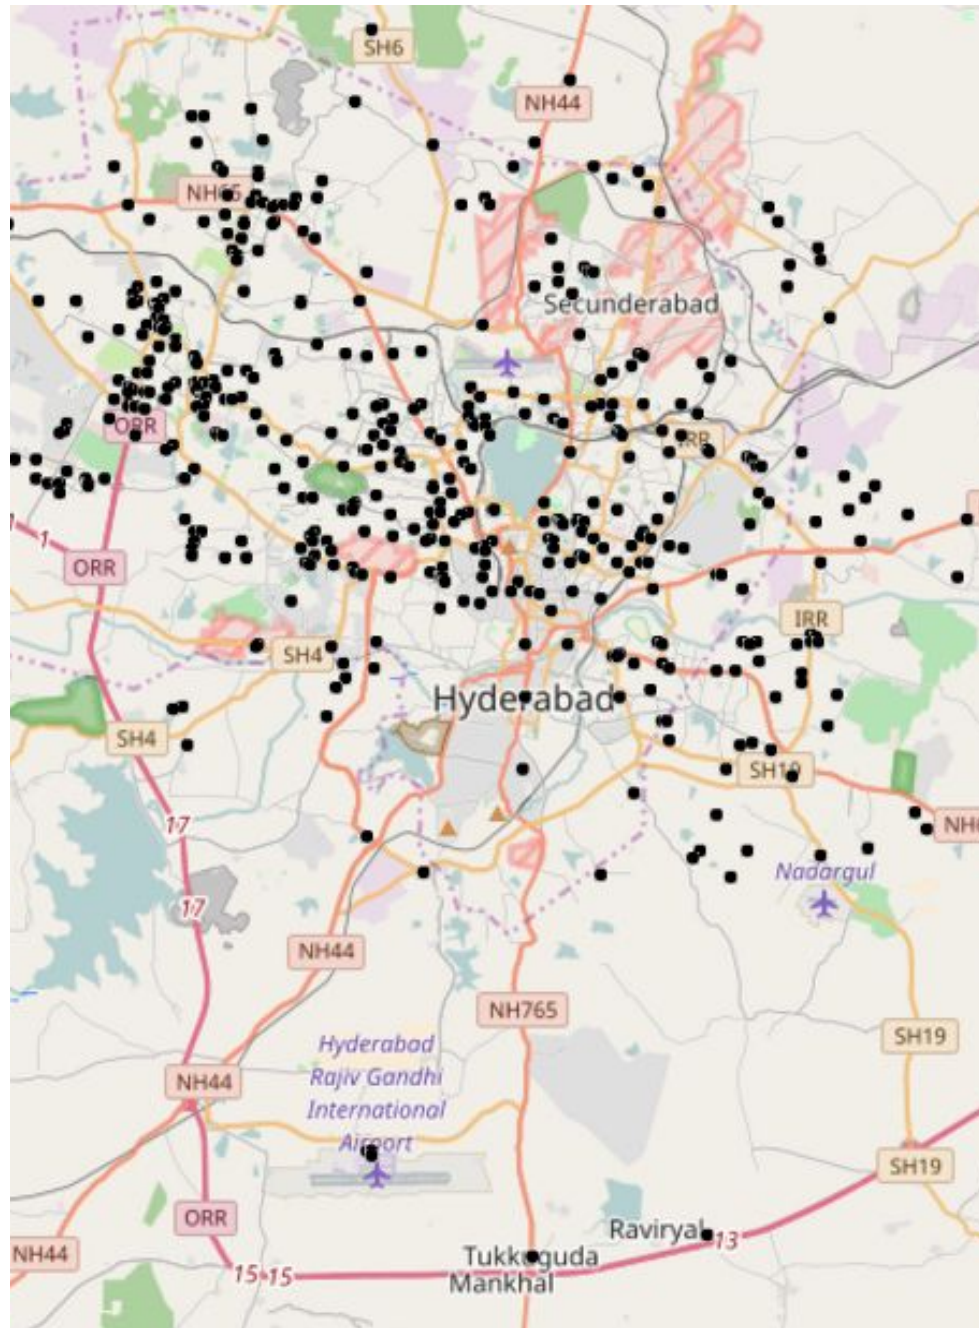

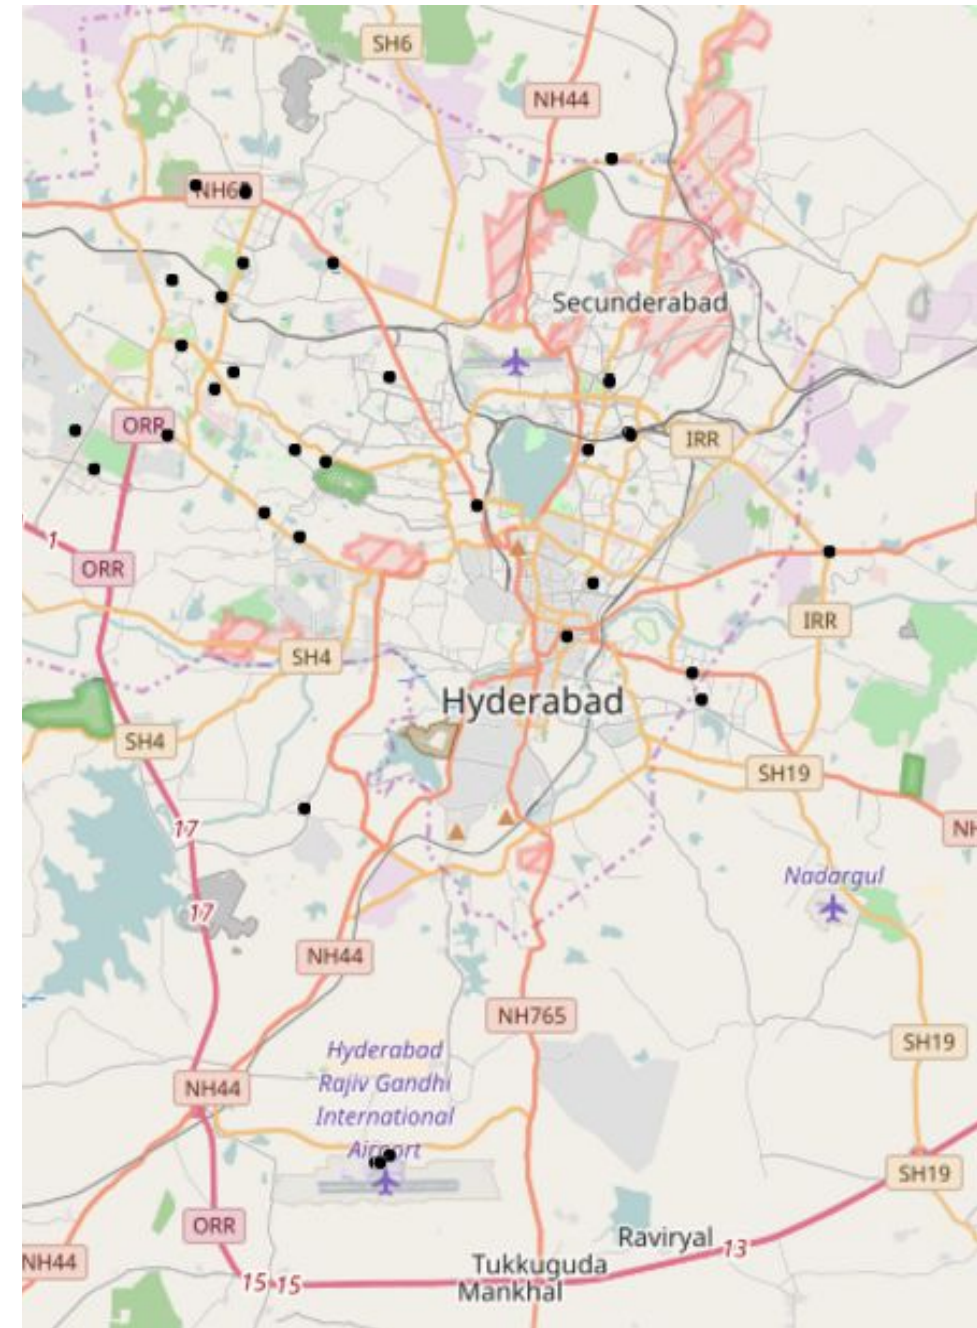

Distribution of ride requests at 2pm in Paris

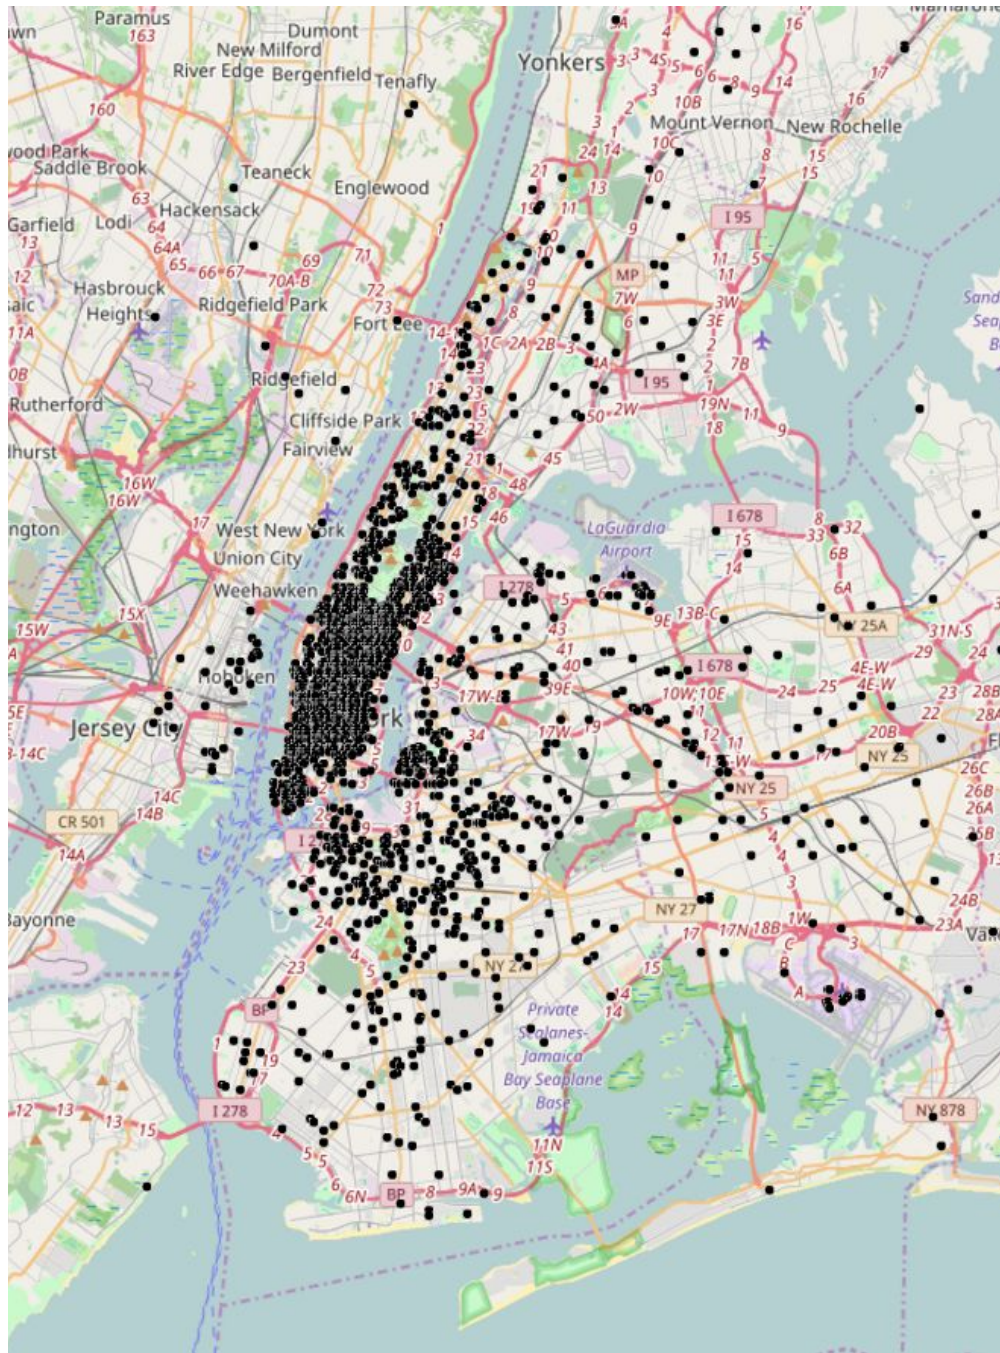

Distribution of ride requests at 4am in Paris

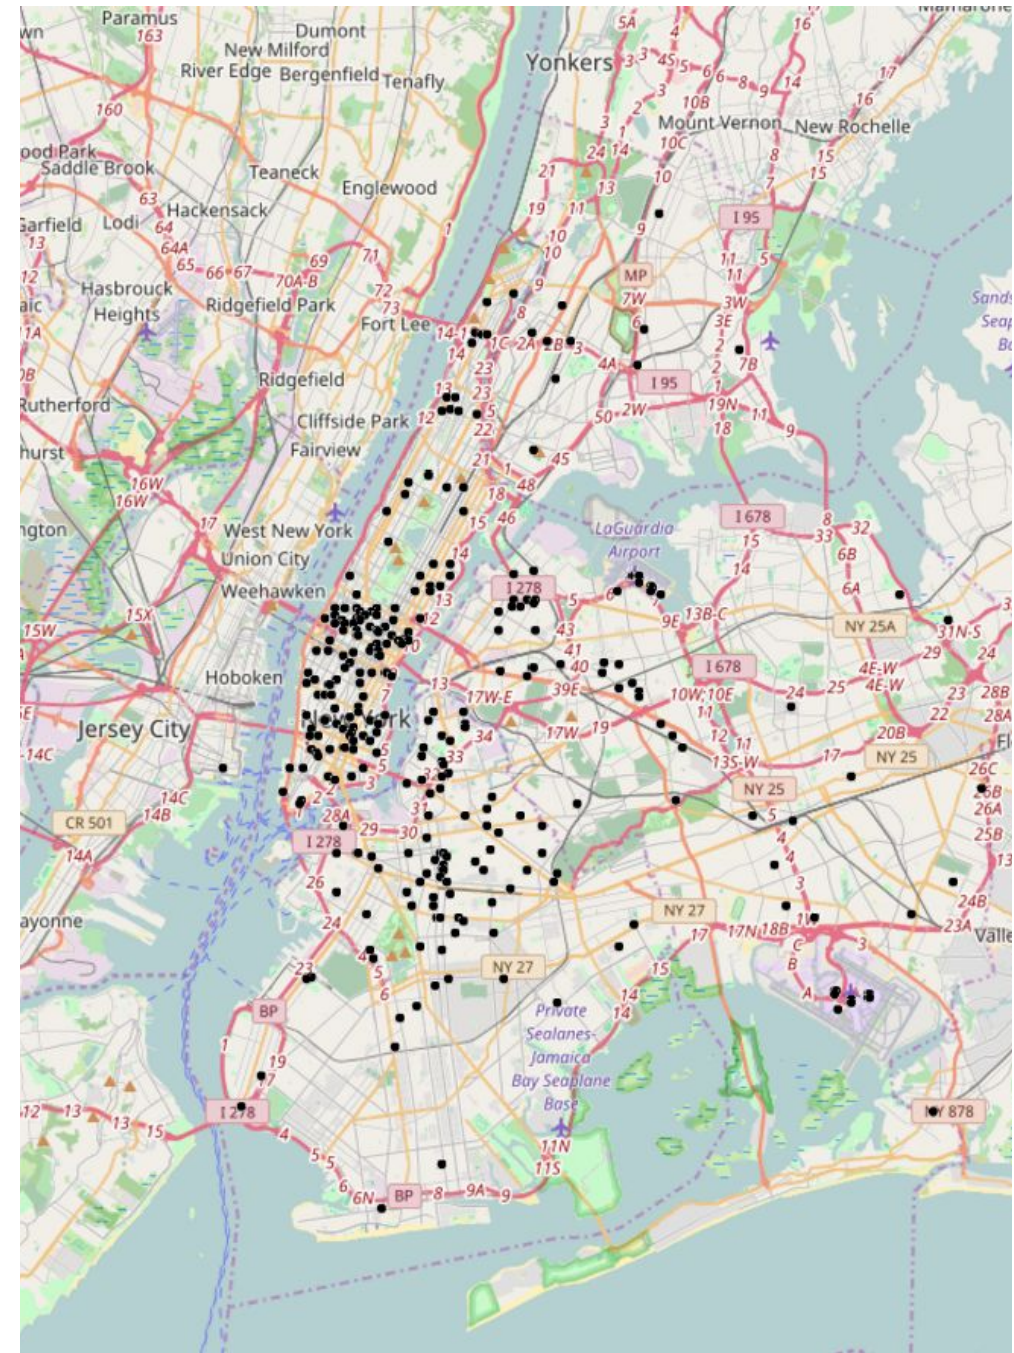

Distribution of ride requests at 11am in Hyderabad

Distribution of ride requests at 5am in Hyderabad

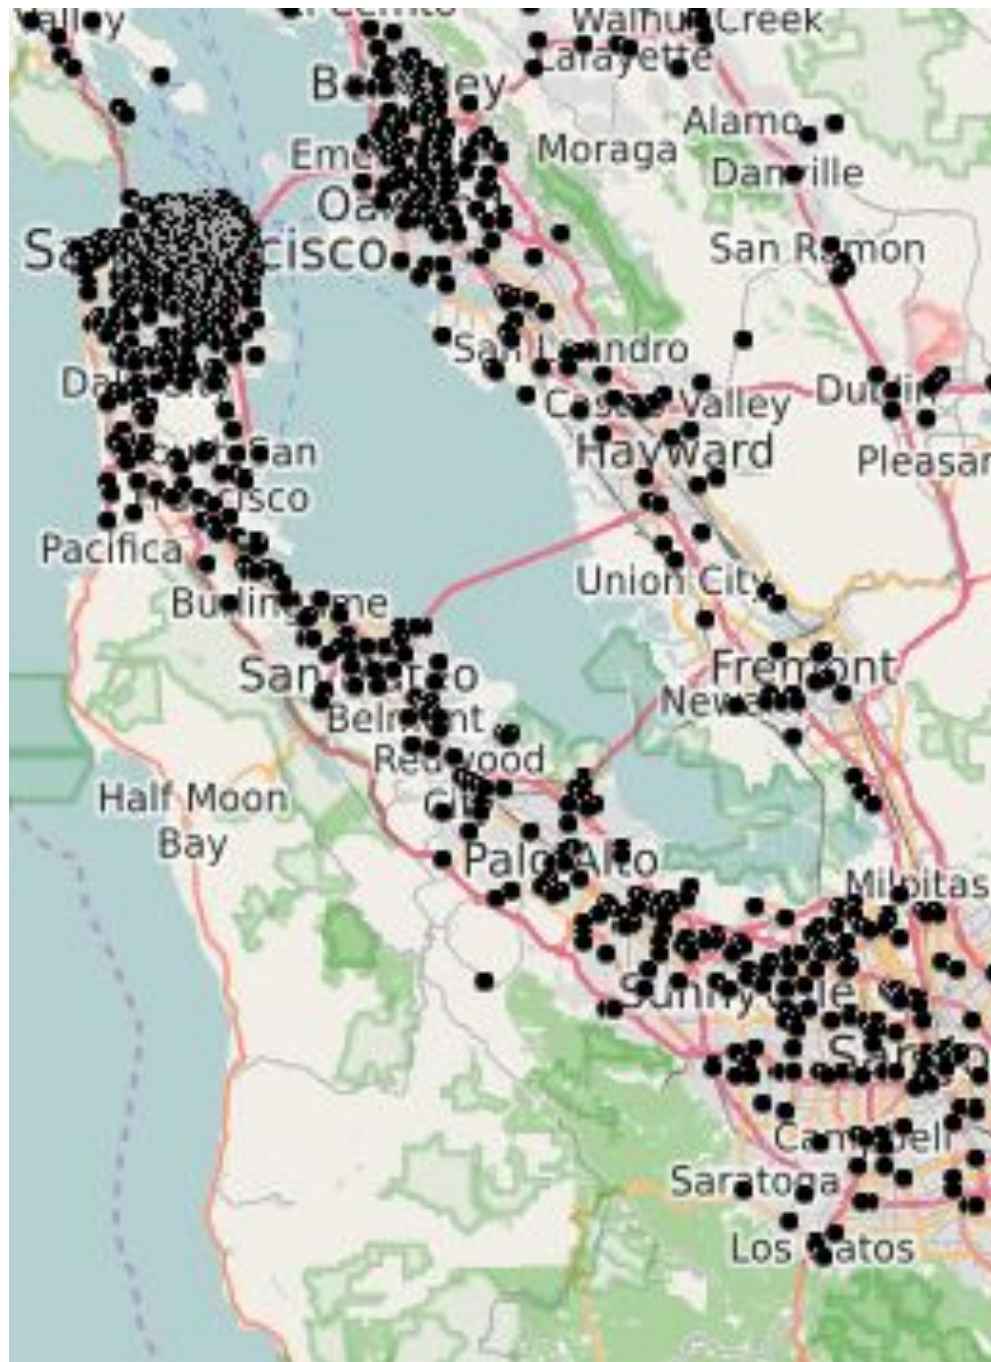

Distribution of ride requests at 8pm in NY

Distribution of ride requests at 3am in NY

Distribution of ride requests at 7pm in SF

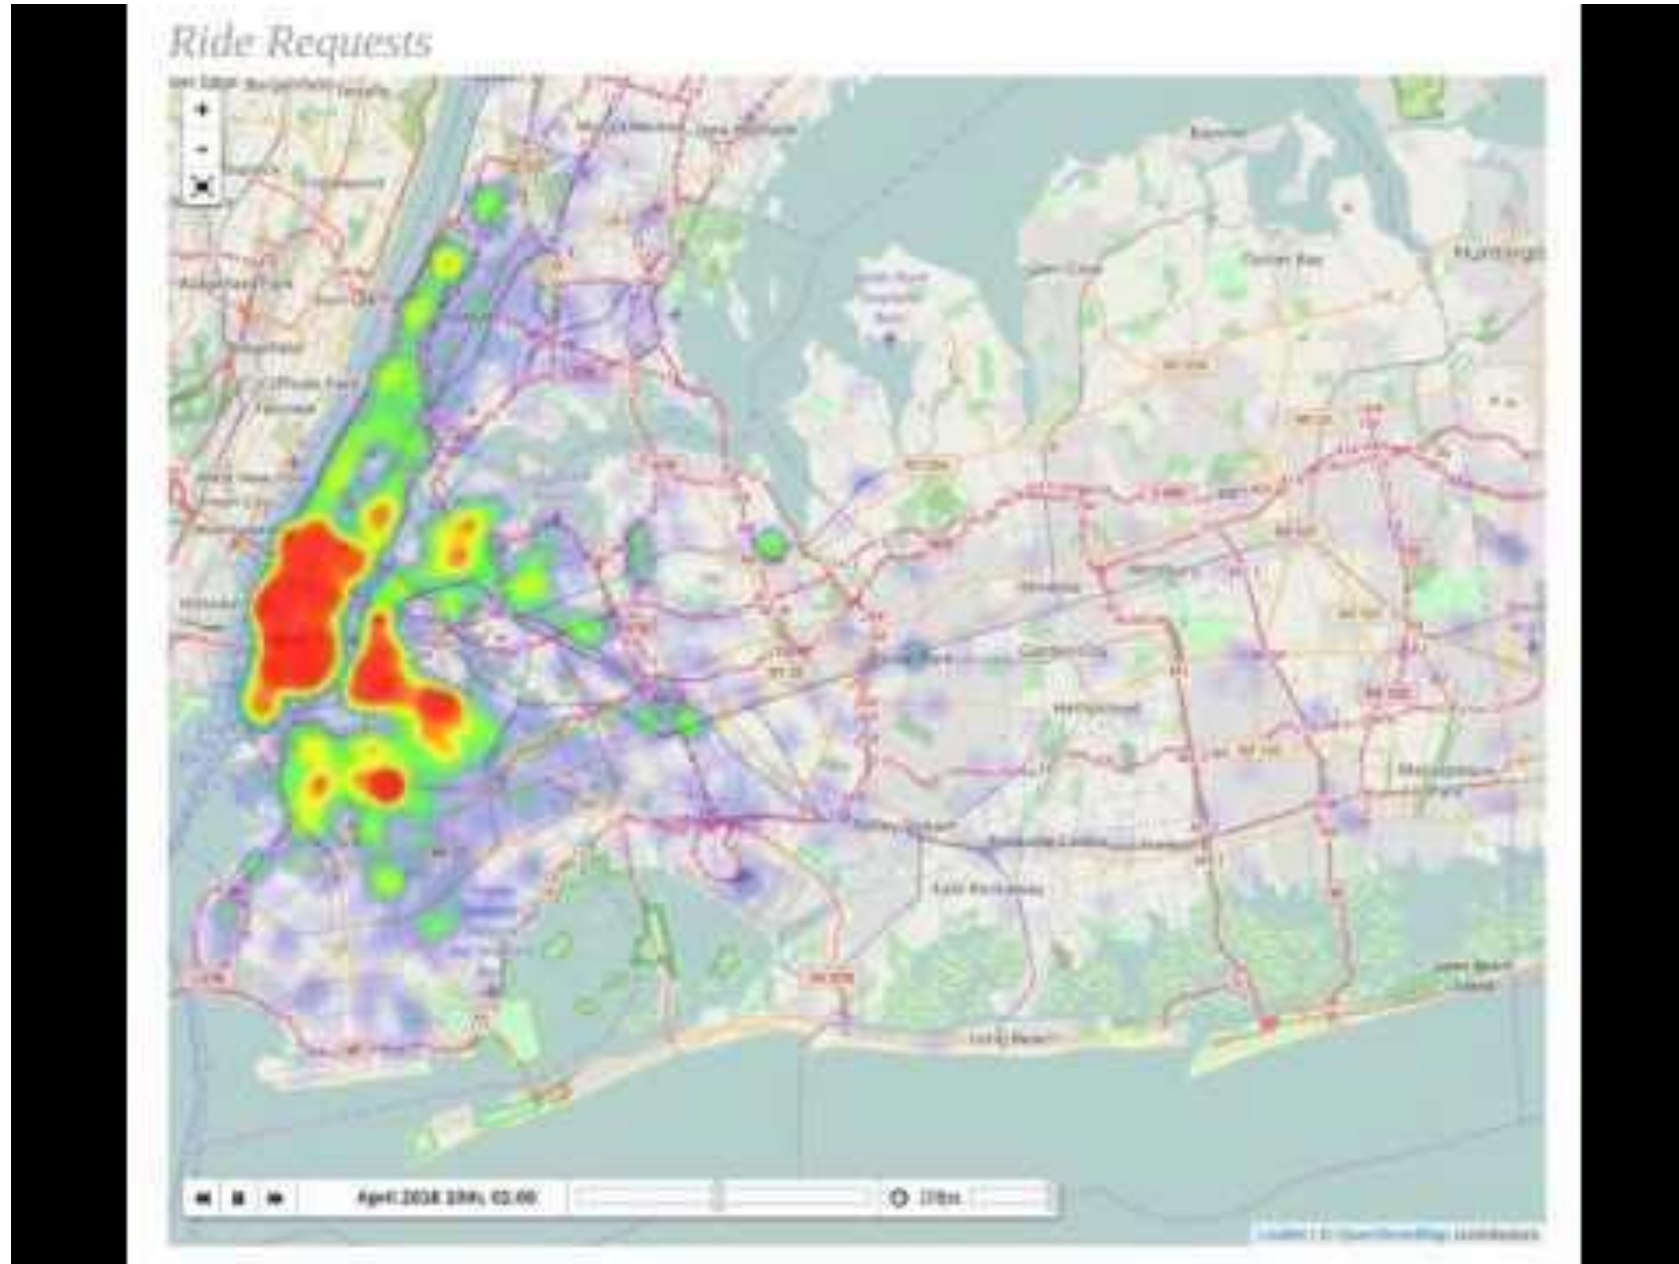

Distribution of ride requests at 5am in SF

# Average Ride Requests per Hour

<b>City</b>	<b>Hourly Average</b>
Paris	3.5K
Hyderabad	1.5K
New York	7.7K
San Francisco	6.4K

Recent emergence of ride-sharing services is transforming human mobility and transportation in major cities of the world (Buzzfeed 2016). In December 2015, Uber Technologies, Inc. reported completion of a billion rides (Fortune 2015) within five years since it started operations. Didi alone in China reported 1.4 billion ride requests in 2015 (Wired 2016). They are expecting to reach 6 billion ride requests in 2016. There is huge potential for such services to transform urban transportation and automotive industries.

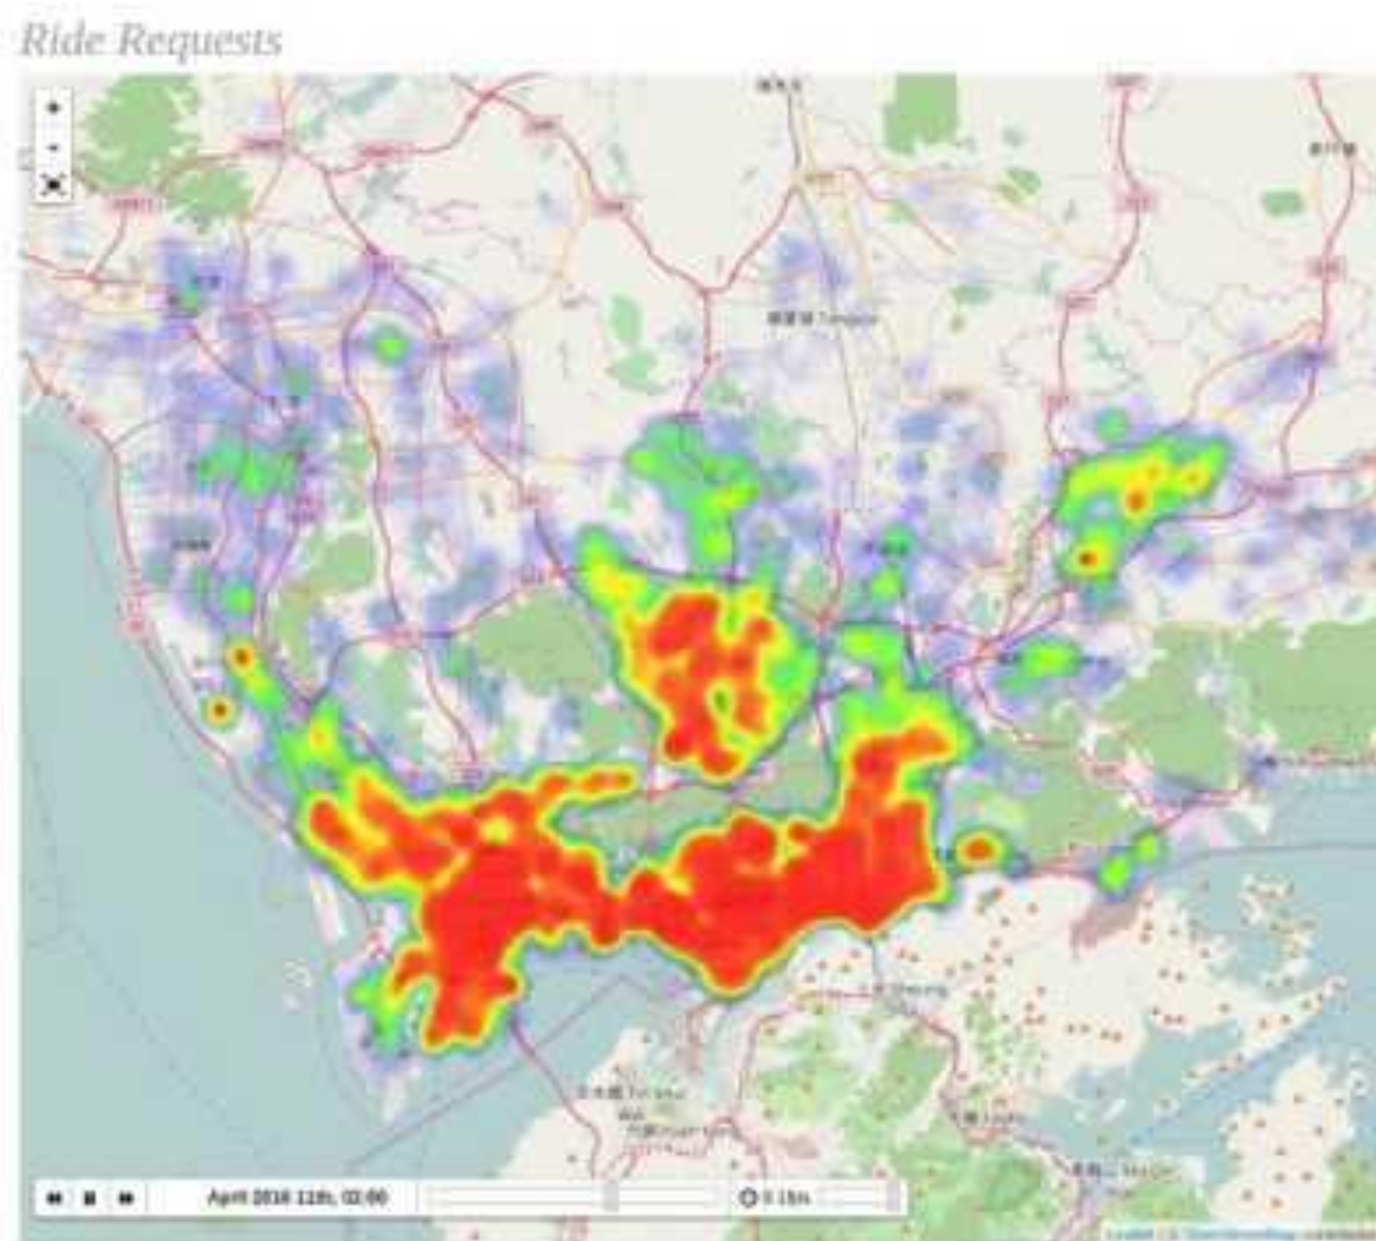

# Ride Requests in New York

# Ride Requests in San Francisco

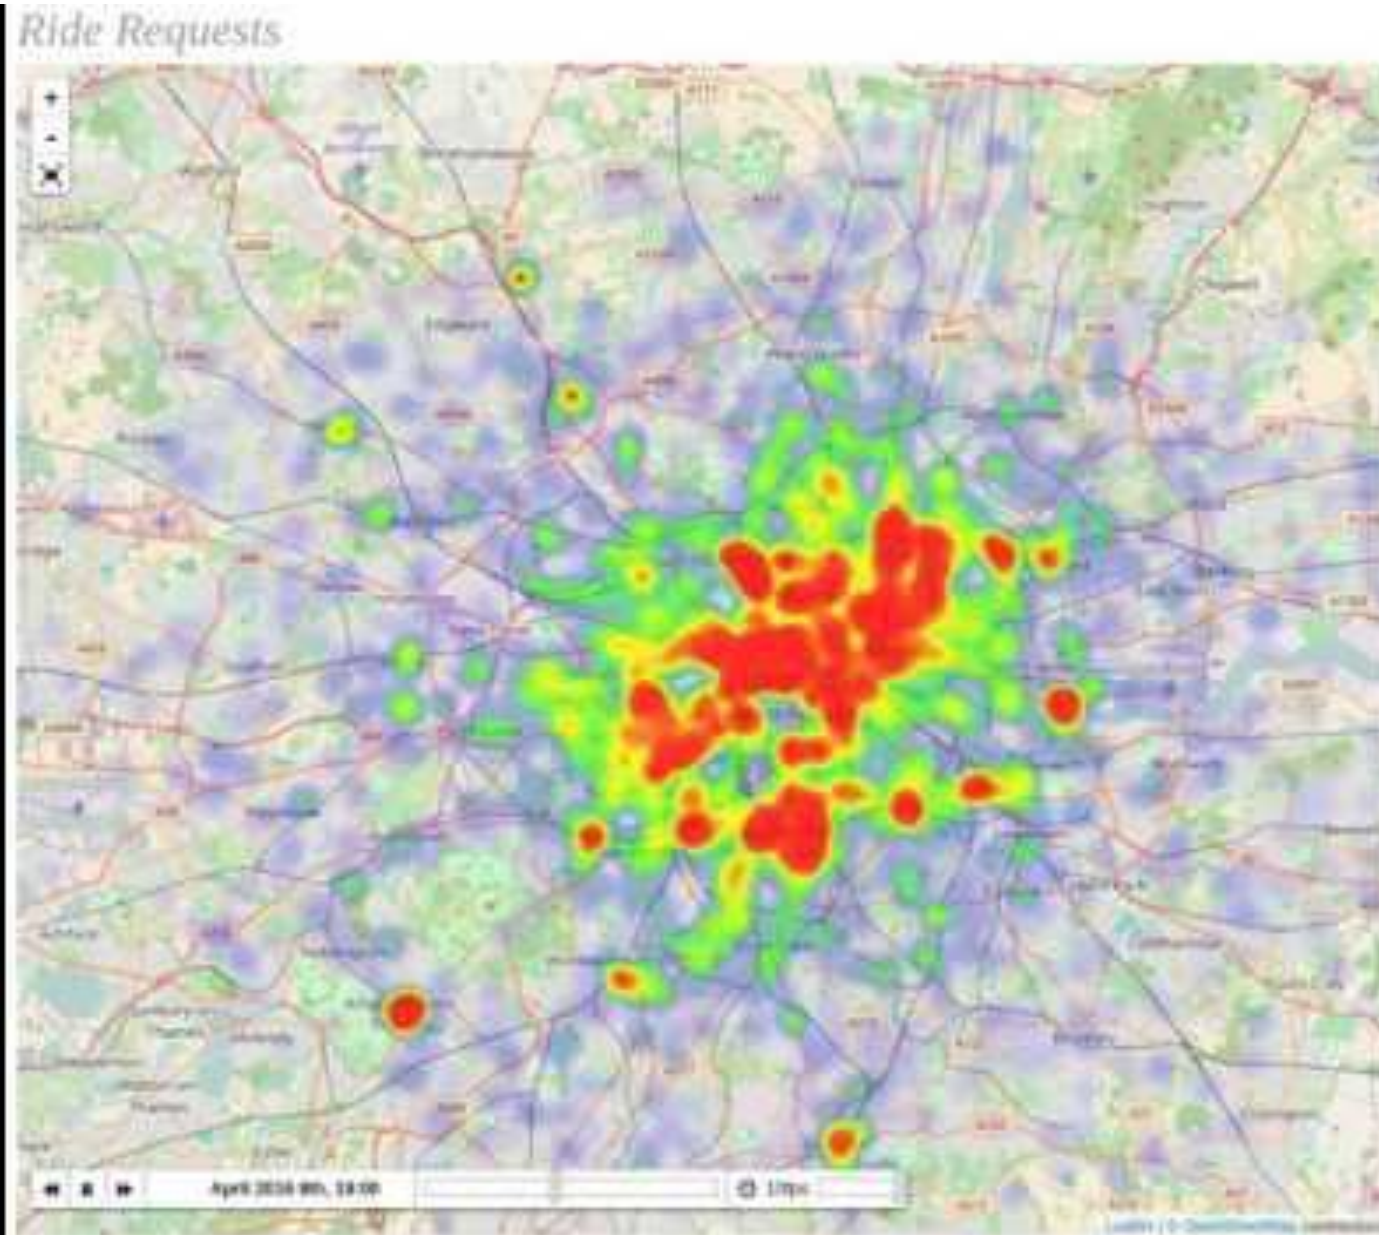

# Ride Requests in Shenzhen

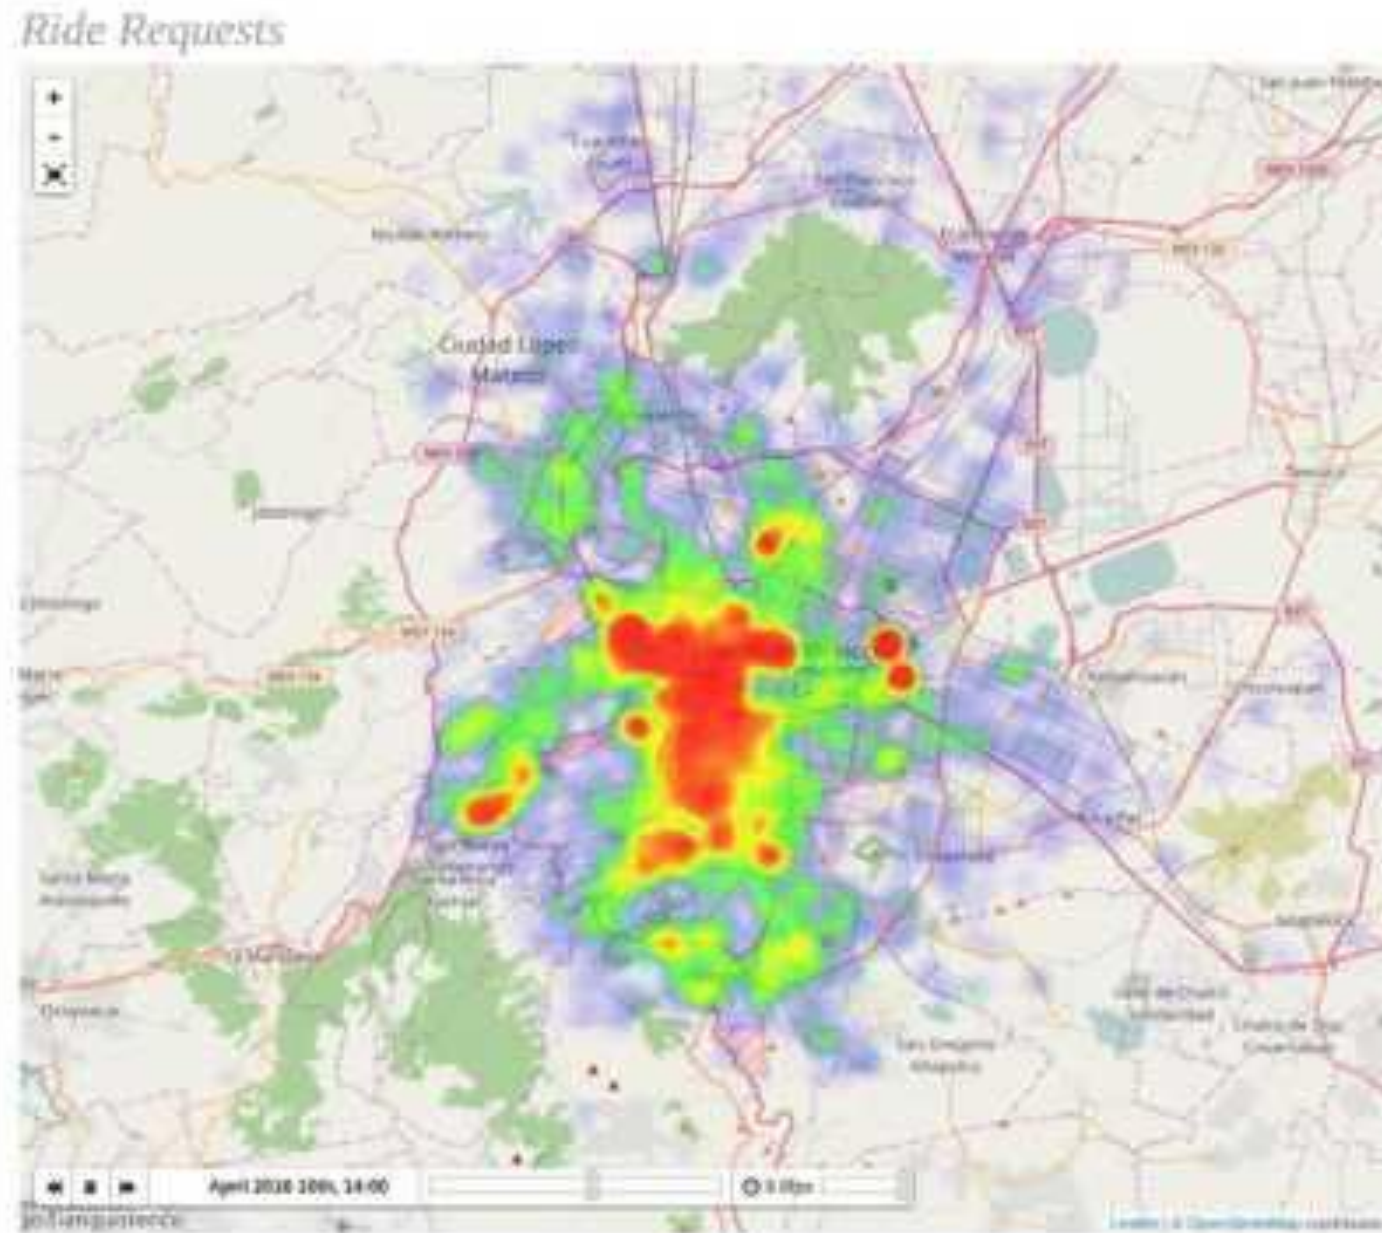

# Ride Requests in Paris

# Ride Requests in London

# Ride Requests in Mexico City

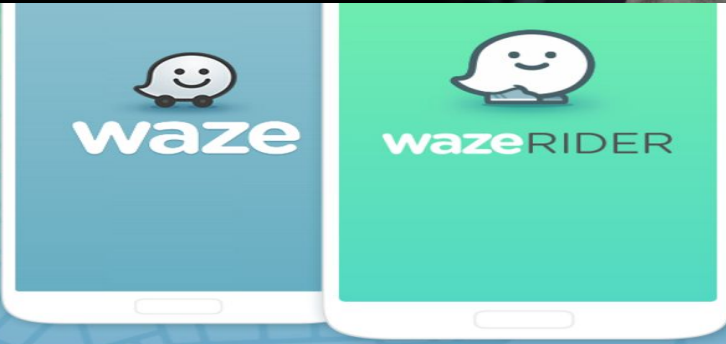

Observation 1: There is significant variability in the **ride request patterns** from city to city, and across space and time within each city.

All major ride-sharing services are introducing “ride pooling” to reduce number of vehicles needed on the roads and to increase the overall efficiency of ride-sharing services.

**Carpool Heroes Wanted**

Join Waze Carpool, a trusted community of drivers and riders teaming up to make commuting more convenient and affordable by riding together.

[Download](#)

**One driver, one rider, one less car on the road**

Waze Carpool is an easy way for everyone to:

-  Help each other out
-  Spend less money on commute costs
-  Make the most of a drive that's happening anyway
-  Support a greener commute with fewer cars on the roads

## Didi Kuaidi, China's Dominant Taxi App Firm, Launches Carpooling Service

Posted Jun 1, 2015 by [Jon Russell \(@jonrussell\)](#)

Uber launched a nonprofit car-pooling service in China called People's Uber last year, and now its biggest rival — and China's largest ride-sharing service — has followed suit with a

FOUNDED  
2012

#### OVERVIEW

Founded in 2012, DIDI is the world's largest mobile transportation service platform, offering a broad range of mobile technology-based transportation options across over 400 major Chinese cities, including taxi hailing, private car hailing, Hitch (social ride-sharing), Chauffeur, DIDI Bus, DIDI Test Drive, and DIDI Enterprise Solutions. As the leader in China's sharing economy initiative, DIDI ...

# What is "Ride Poolability"?

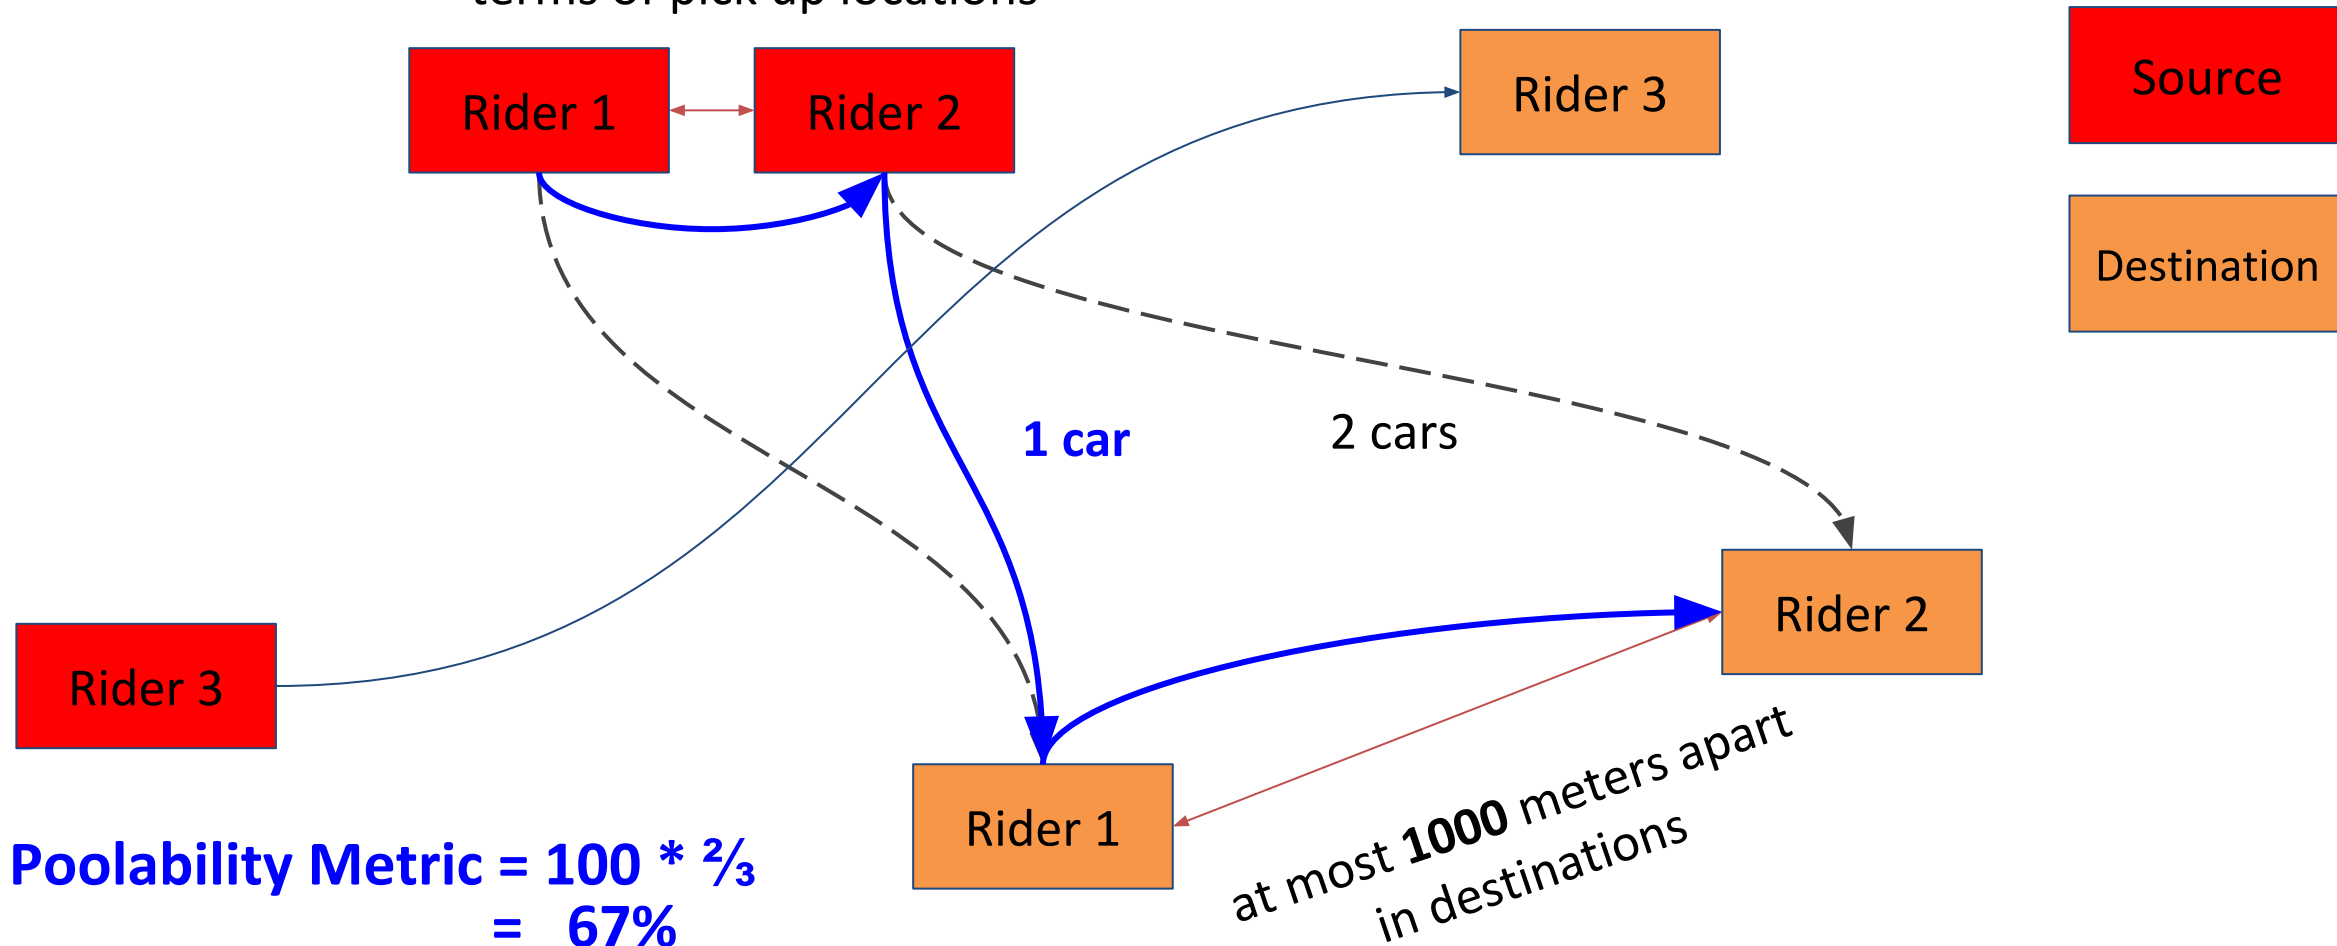

Each Ride Request:  $\langle t, s, d \rangle$   
Proximity Constraints for Pooling:

$\Delta(t) < 5min$

$\Delta(s) < 100m$

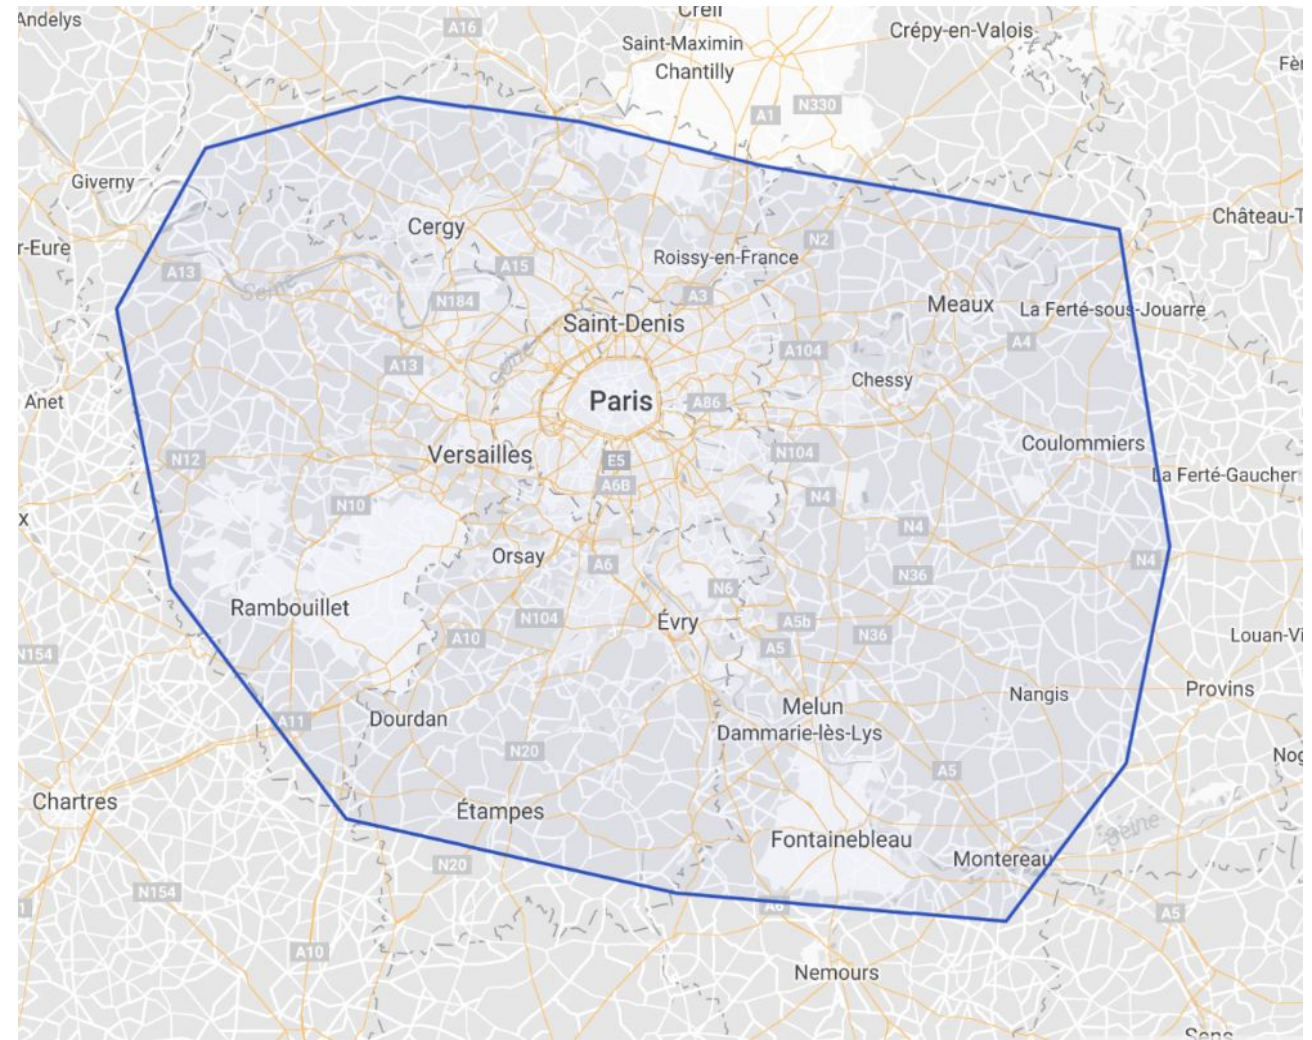

$\Delta(d) < 1000m$

at most **100** meters apart in terms of pick up locations

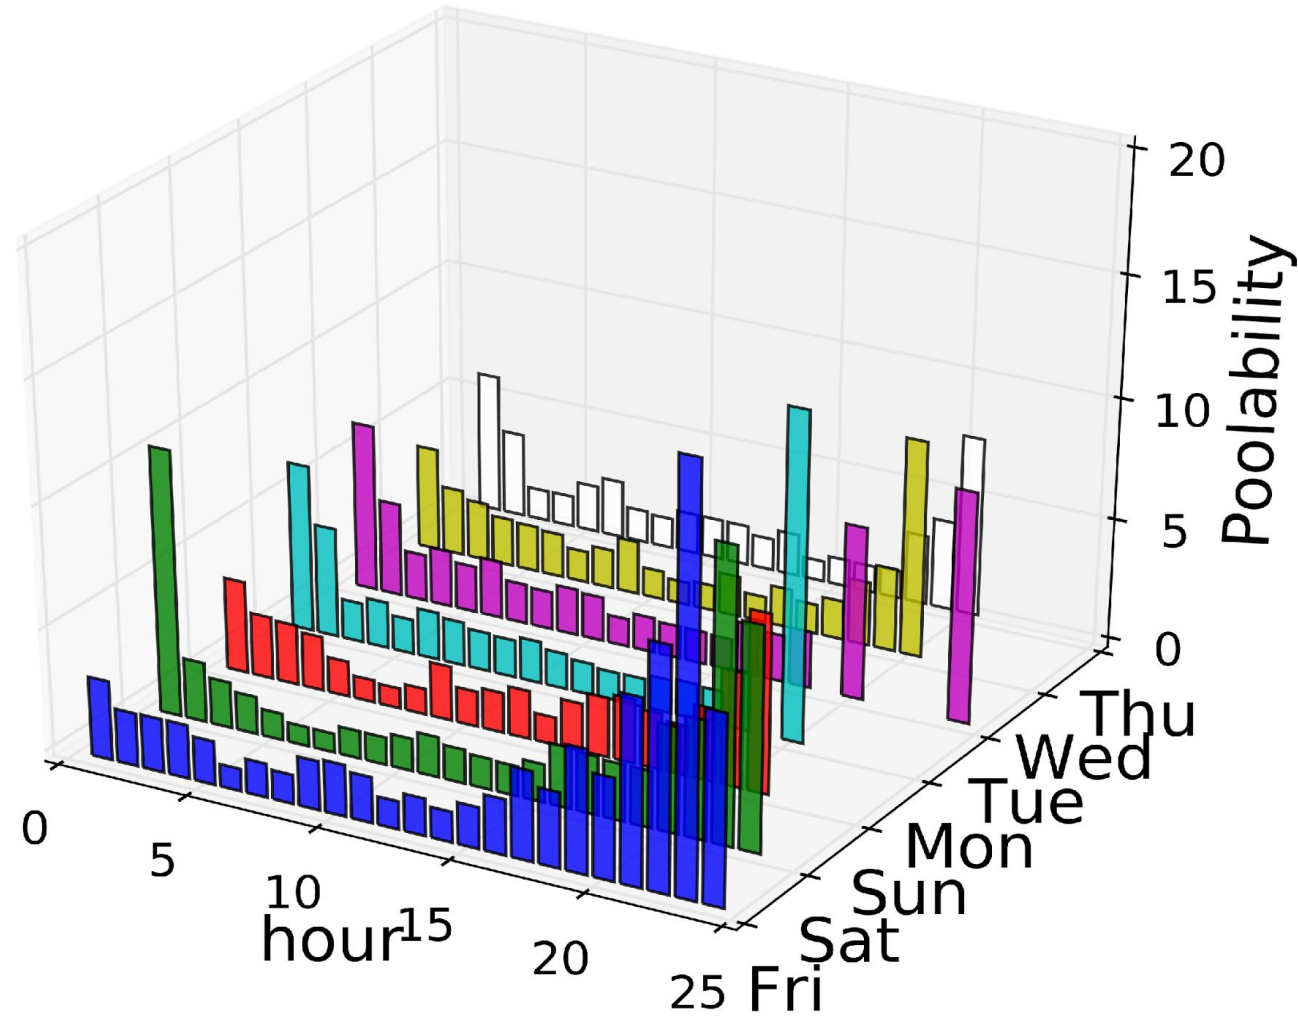

Poolability Metric =  $100 * \frac{2}{3}$   
= **67%**

# Ride Poolability Profile for Paris

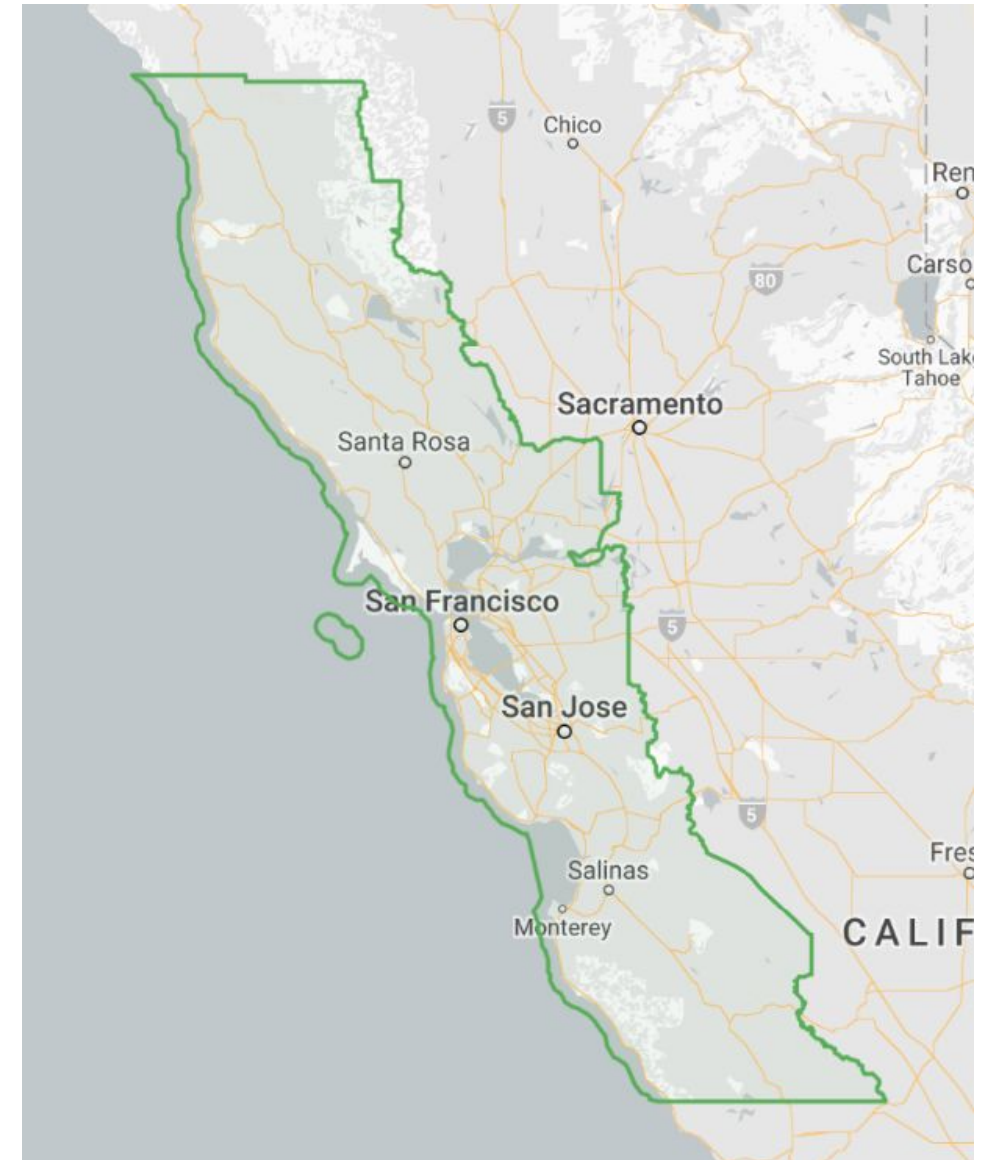

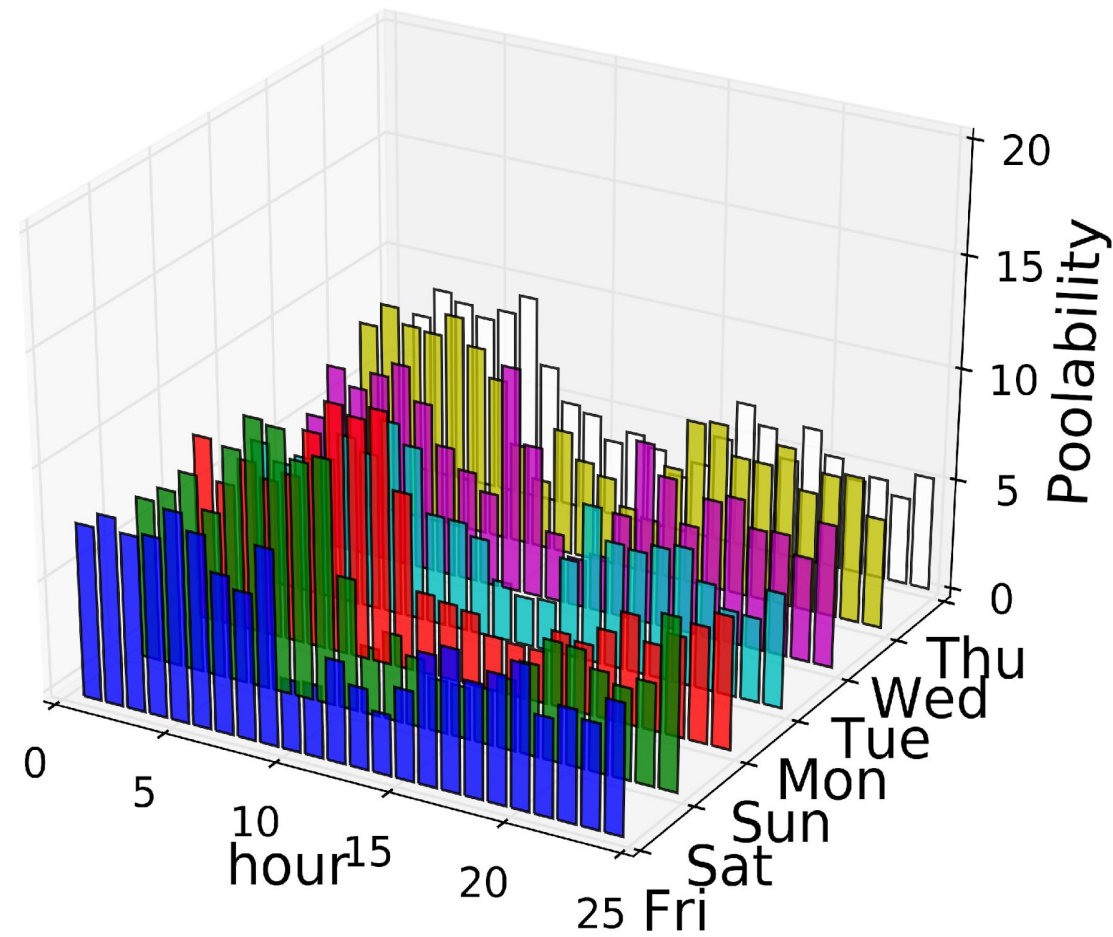

# Ride Poolability Profile for Hyderabad

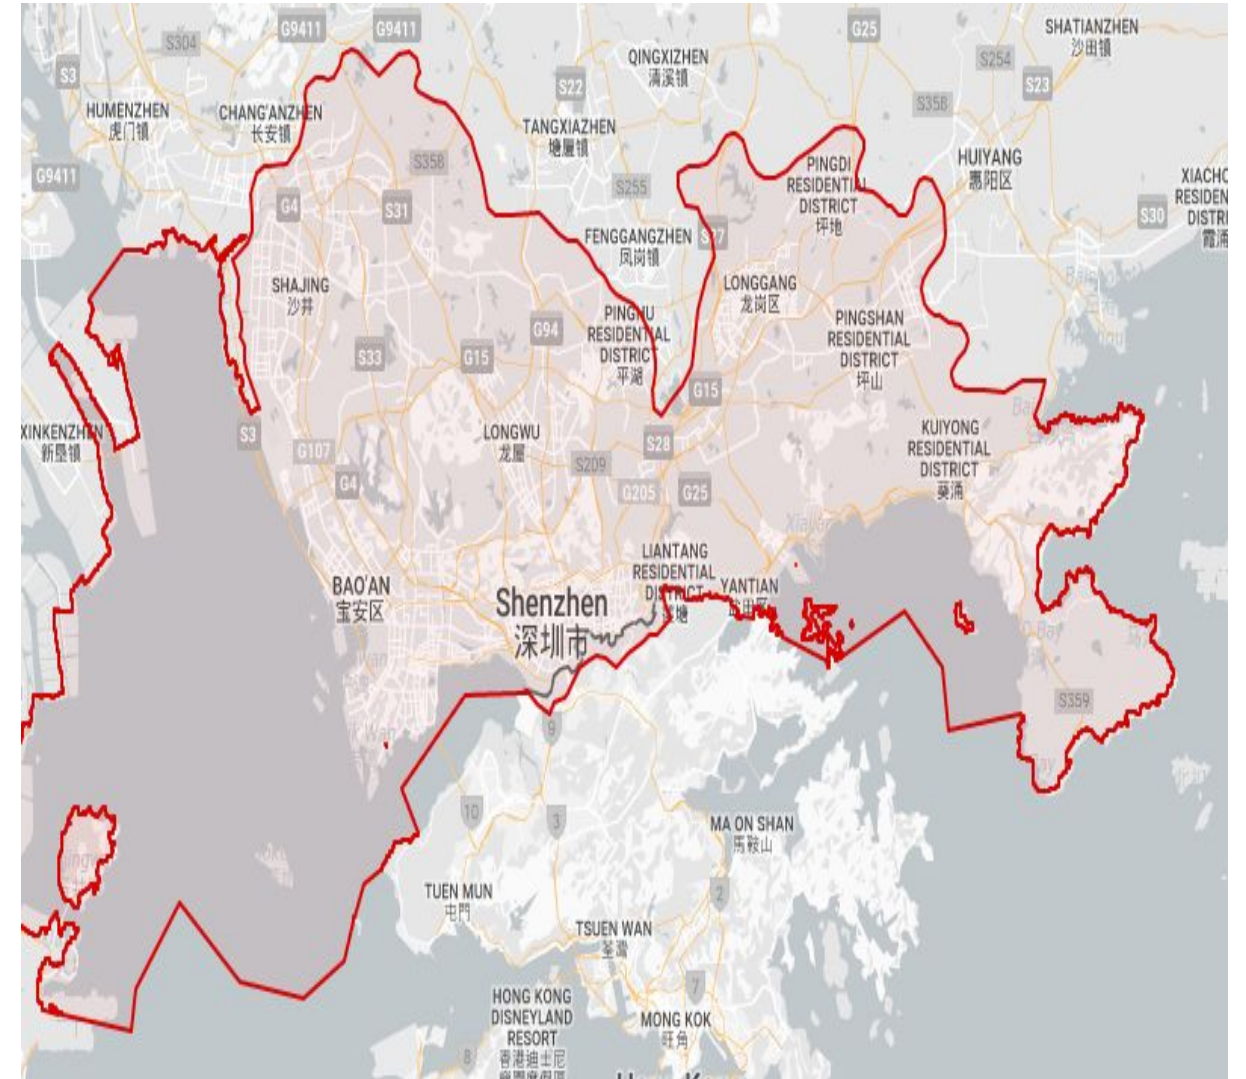

# Ride Poolability Profile for New York

# Ride Poolability Profile for San Francisco

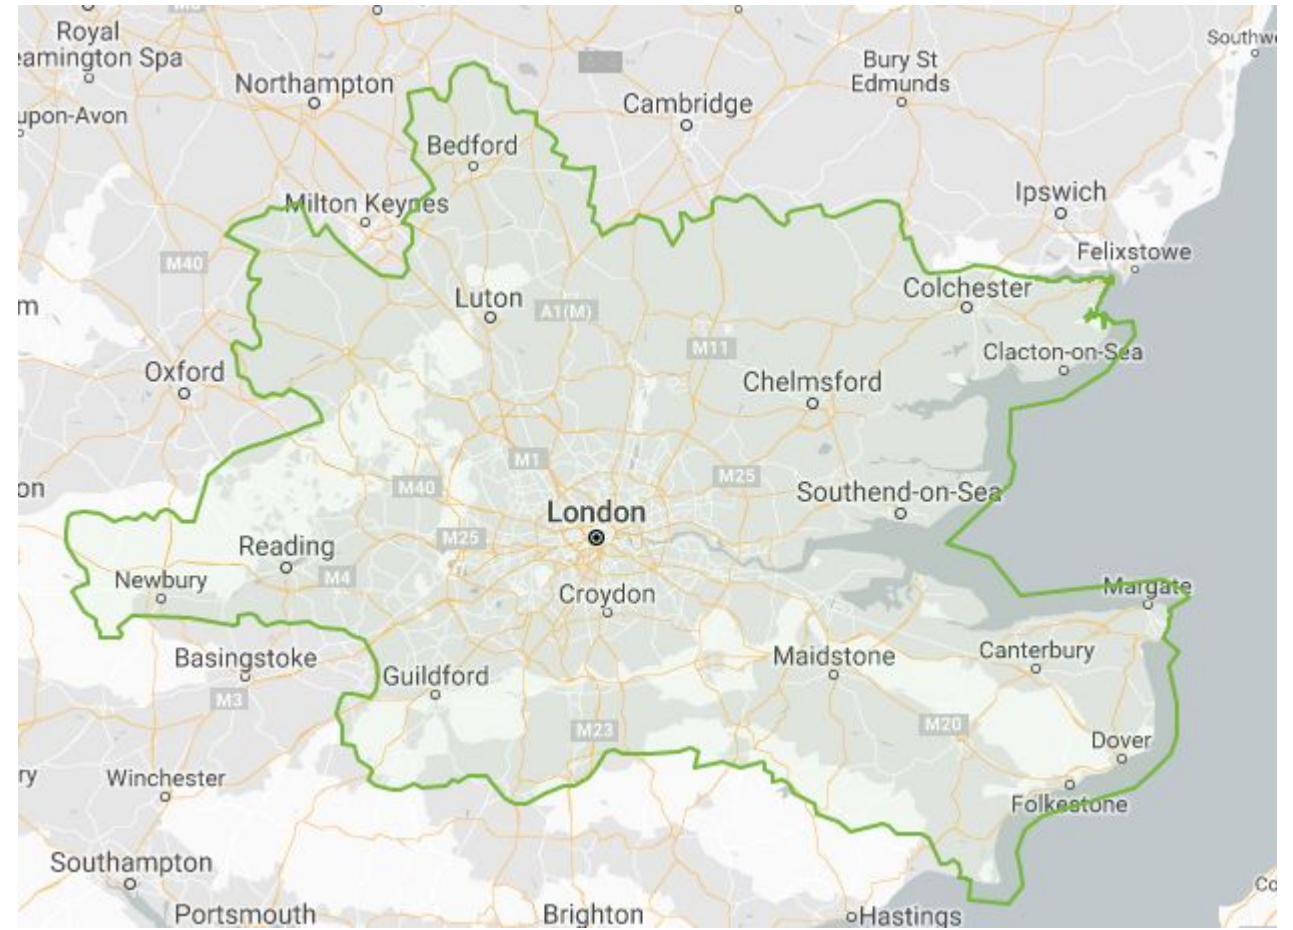

# Ride Poolability Profile for Shenzhen

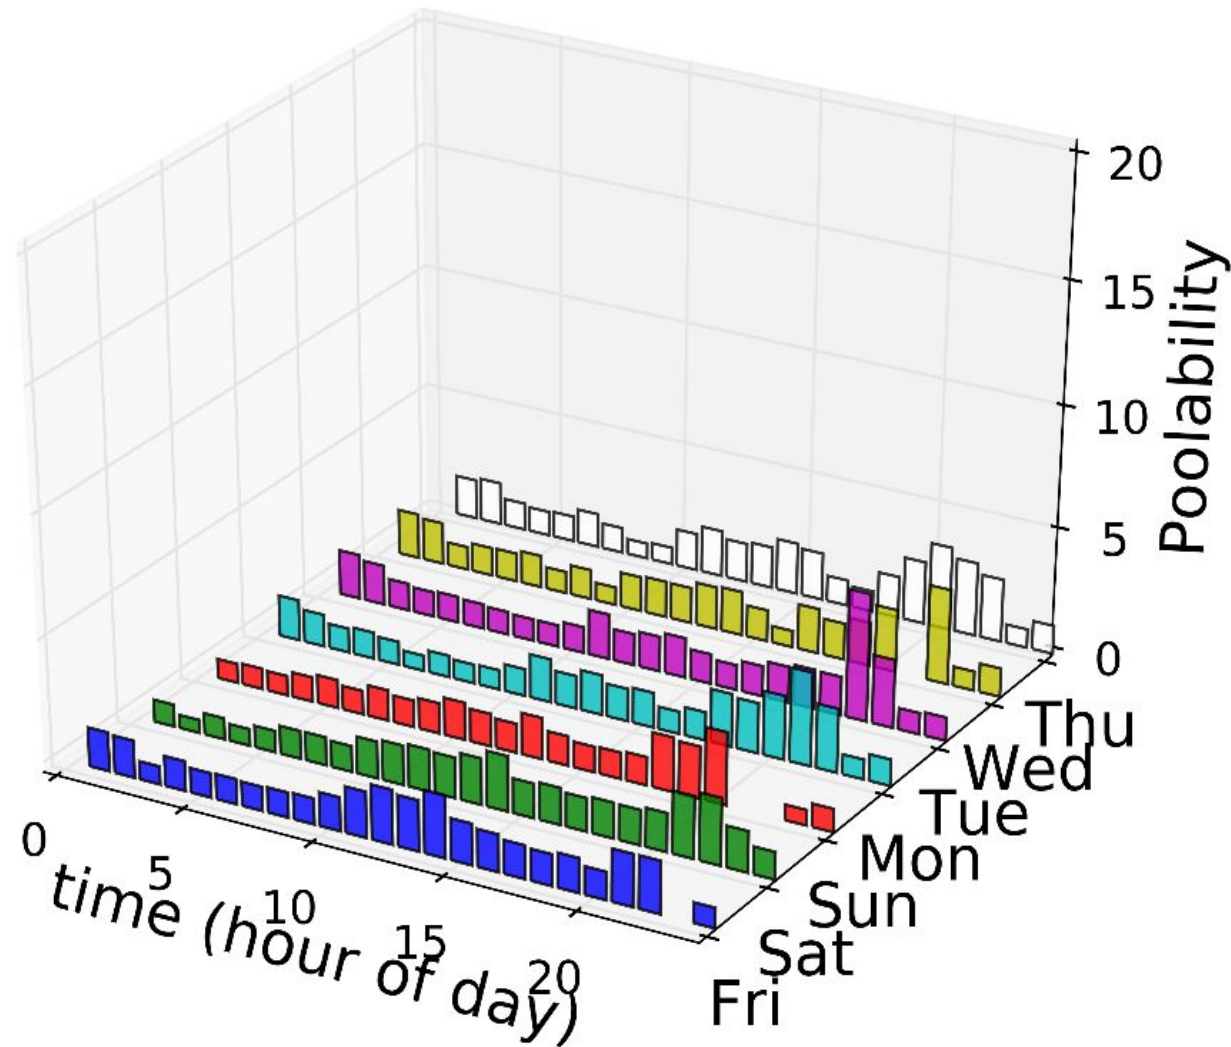

# Ride Poolability Profile for London

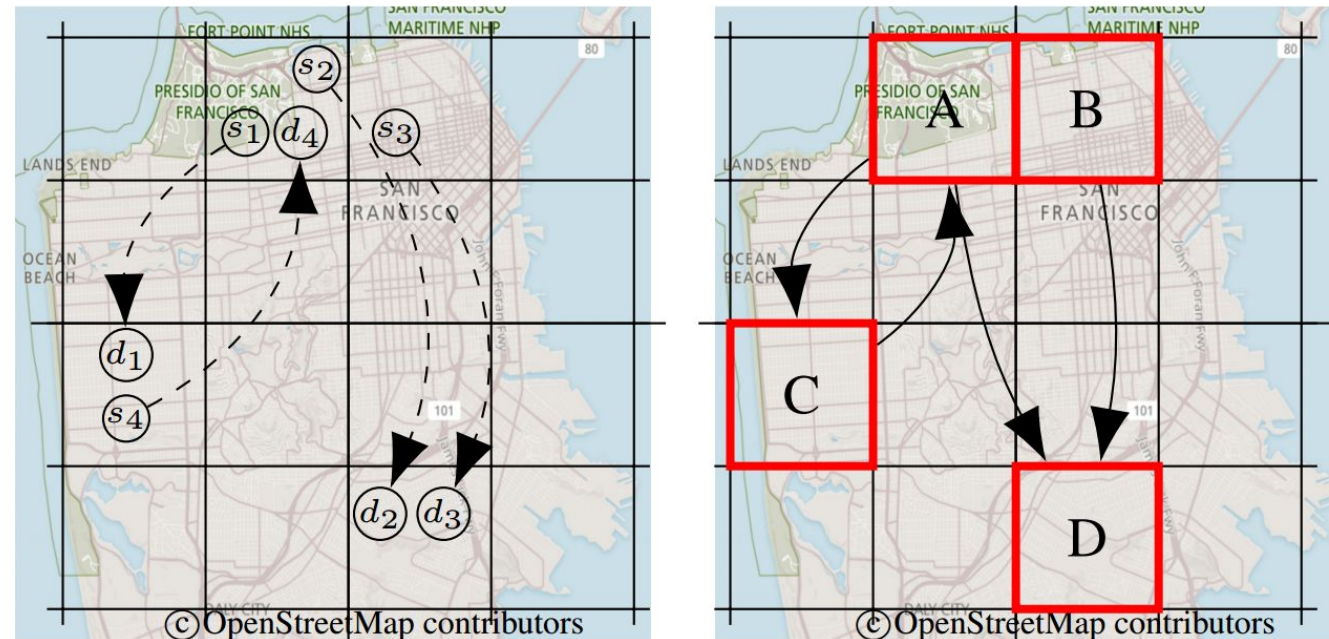

# Ride Poolability Profile for Shanghai

Observation 2: There is similar variability in the **ride poolability profiles** from city to city, and across space and time within each city.

Question 1: Is there a rigorous model that can capture both the spatial and temporal variations of **ride request patterns** in a city?

# Ride Request Graph (RRG)

(a) Four ride requests distributed spatially over a map

(b) Corresponding Ride Request Graph with four nodes (marked by red boxes) and directed edges.

Multiple instances of RRG can be created at every time instance, let's say every 5 minutes.

# Densification Power Law (DPL)

Time-evolving graph like Arxiv citation graph, the Patent citation graph, and many others share a common property i.e. DPL.

(a) arXiv

(b) Patents

Image source: Chakrabarti, D., & Faloutsos, C. (2006). Graph mining: Laws, generators, and algorithms. *ACM computing surveys (CSUR)*, 38(1), 2.

# Densification Power Law property of RRG

Suppose, we have  $N(t)$  nodes, and  $E(t)$  edges at time  $t$ , and if at  $t+1$ ,  $N(t+1) = 2 * N(t)$ , what will be  $E(t+1)$ ?

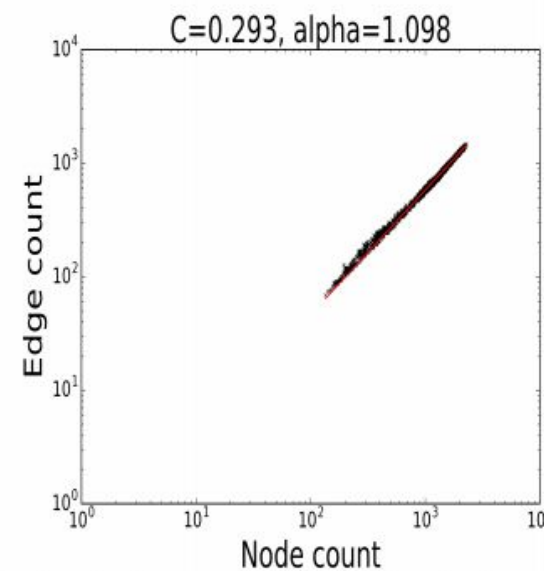

$$E(t) = C * N(t)^\alpha$$

Hyderabad

Paris

New York

San Francisco

Question 2: What is the correlation, if any, between the **ride request patterns** of a city and the **ride poolability profiles** of that city?

# DPL and Ride Poolability

Alpha is correlated with ride poolability due to the “**human community**” effect.

<i>City</i>	<i>Mean</i>	<i>Minimum</i>	<i>Maximum</i>
Hyderabad	2.23	0.84	7.41
Paris	2.39	0.79	4.22
New York	4.48	1.70	7.84
San Francisco	5.48	2.50	9.16

## Auto generation property of DPL graphs

- Graphs exhibiting DPL can be automatically generated
- Auto generation is based on a small number of parameters

## Desiderata for auto generation of RRGs

- Generated graphs should match graphs extracted from real data
- Should exhibit the same **human community** effects
- Use as few parameters as possible to do auto generation
- Should be efficient and scalable

Question 3: Is it possible to auto generate RRGs that exhibit the same DPL metrics as those RRGs extracted from actual real data?

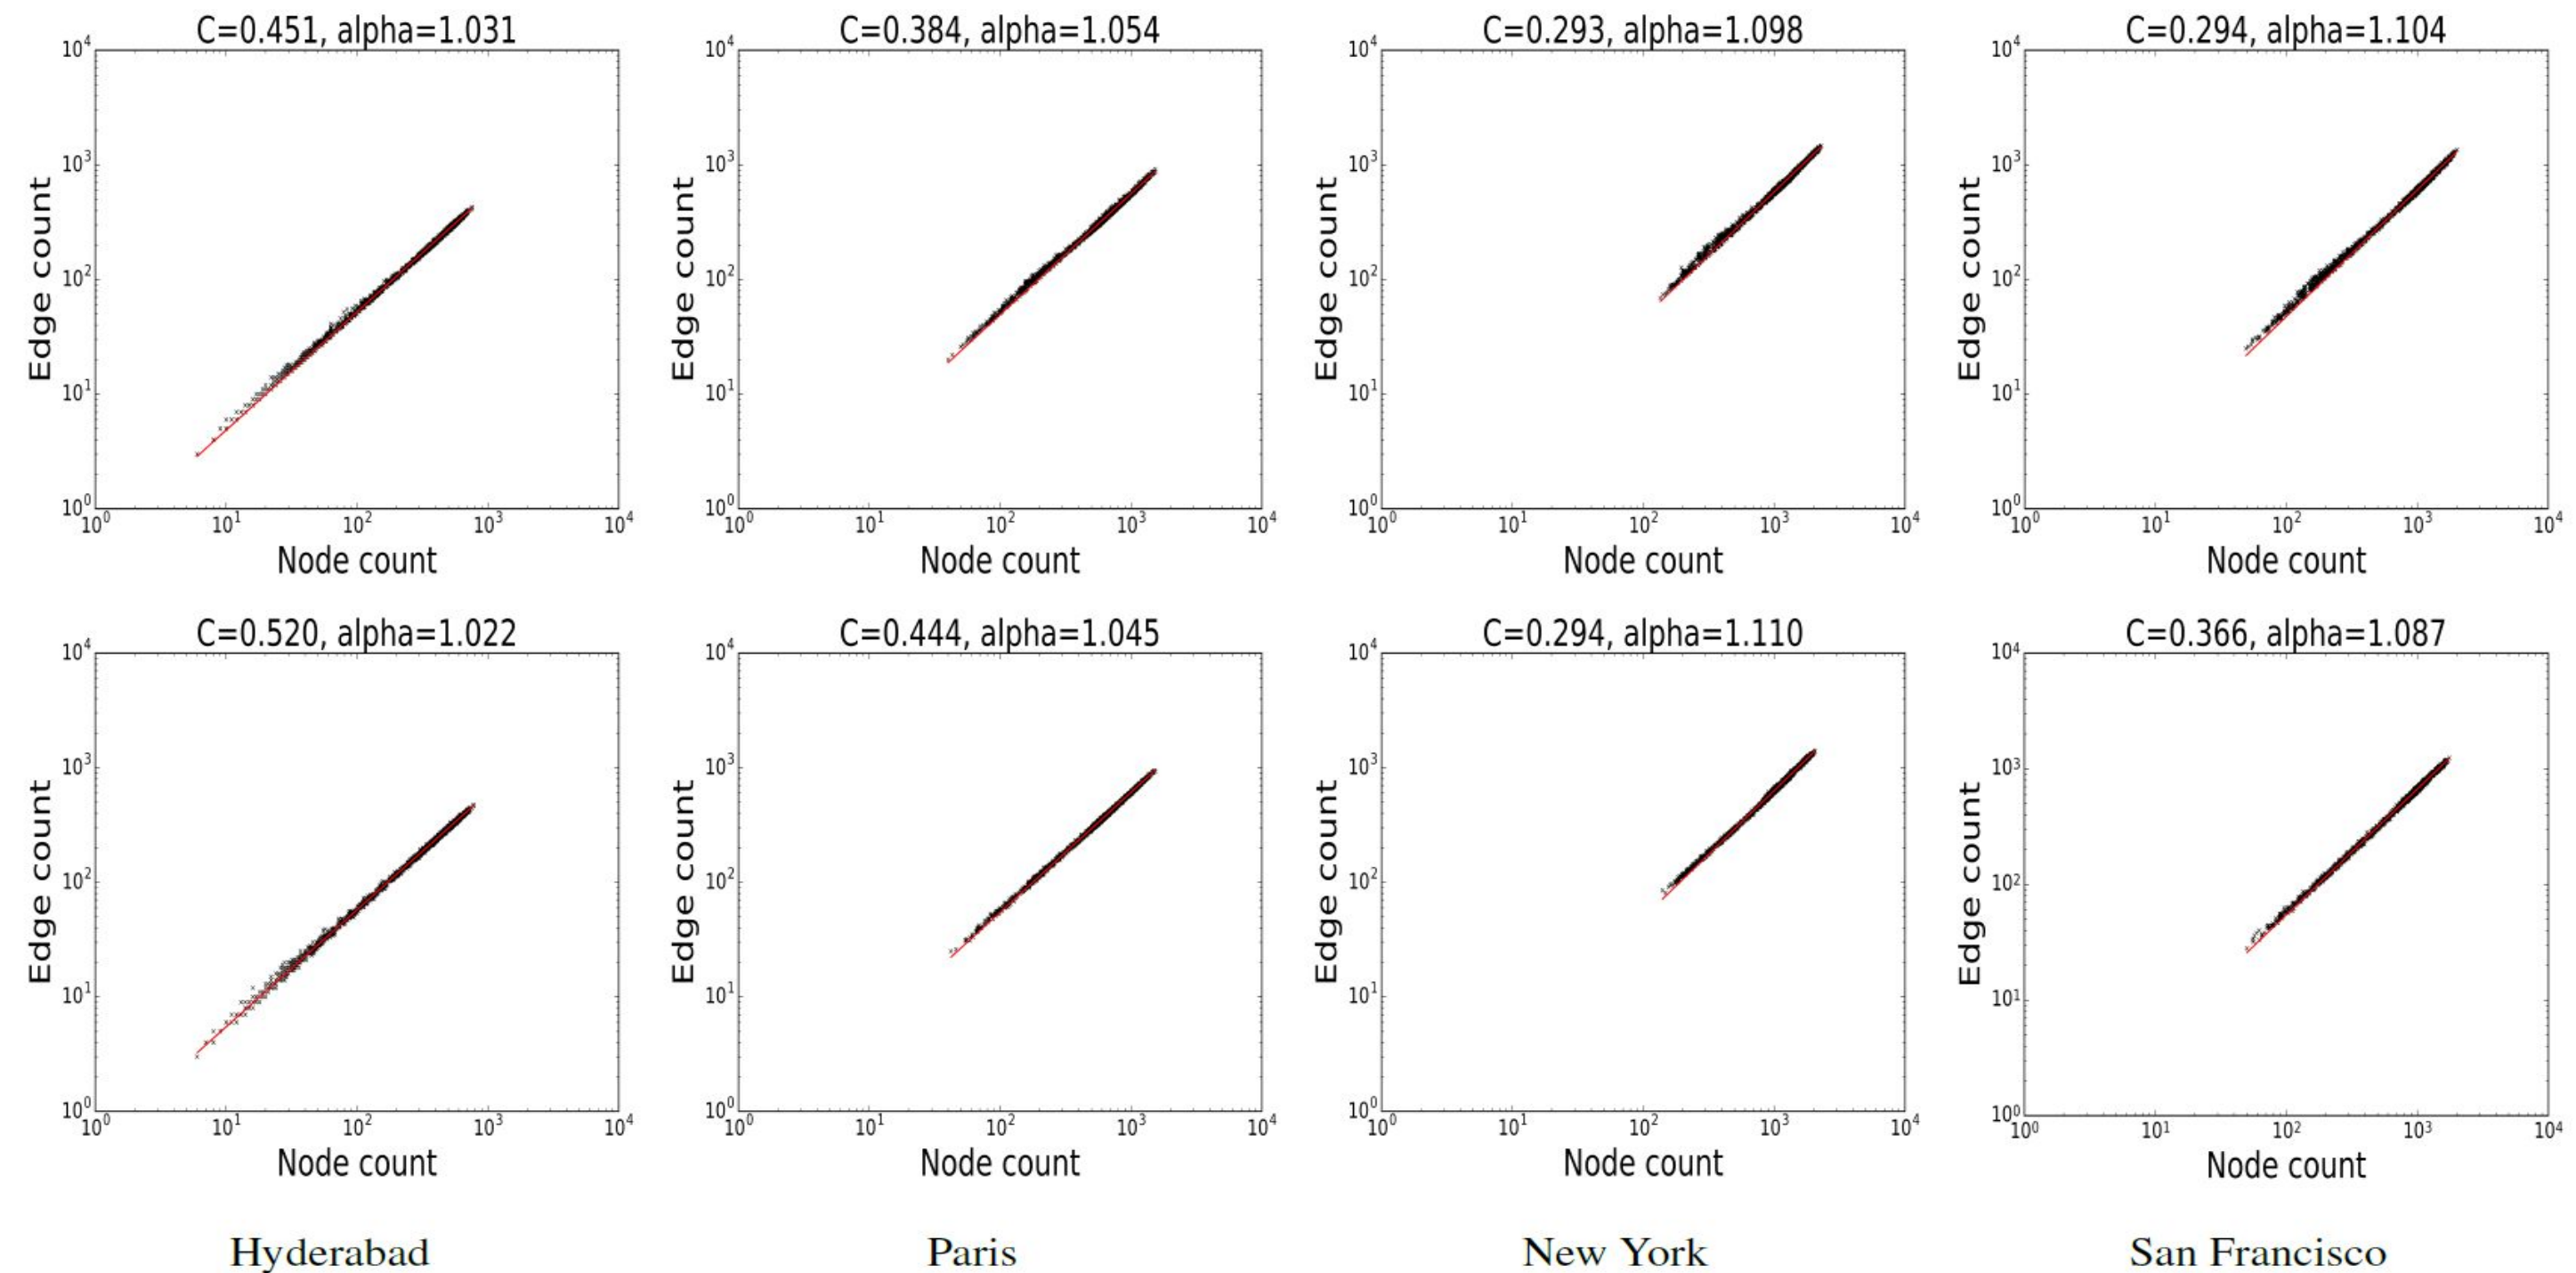

Figure 4: DPL plot from real data (top row) and synthetic data (bottom row) for four cities. The red line is the least square fit of the form  $y = Cx^\alpha$ , where  $y$  and  $x$  are number of edges and nodes respectively.  $R^2 \approx 1.00$  for all of them.

Question 4: Is it possible to create an accurate **ride-request predictive system** based on the analysis of extensive historical data?

Question 5: Can such a ride-request predictive system lead to optimal **ride-pooling algorithm and service** at the city scale?

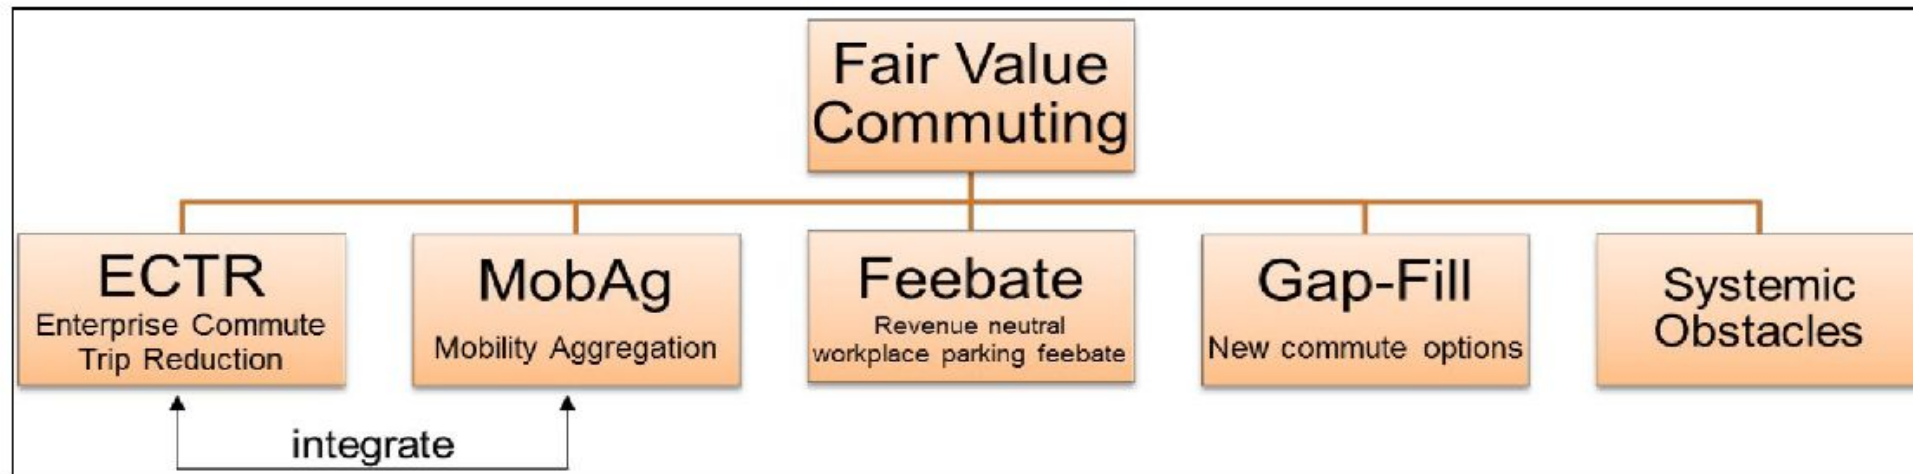

**Bay Area Fair Value Commuting:  
Project Summary**  
An FTA MoD Sandbox Demonstration Project

Link to this google doc: <http://bit.ly/FVCsummary>

**WHY:** In pursuit of climate protection and traffic congestion relief, state/regional/local objectives have converged for 15% per-capita VMT reduction and 2X transit/biking.

**WHAT:** **In pursuit of regional objectives, our solution has the potential to reduce Bay Area SOV commute share from 75% to 50%.** Our technology/policy solution is called Fair Value Commuting (FVC) and consists of five components:

## Promising avenues for future research. Some research questions:

1. If the ride pooling proximity constraints, both temporal and spatial, can be relaxed, is it possible to significantly improve ride poolability?
2. Can the pattern of temporal and spatial variation of ride poolability be leveraged to create intelligent predictive ride pooling algorithms?
3. Can we rigorously characterize the relationship between ride poolability and ride request graph densification power law factor?
4. Is it possible to use the space-time graph model extracted from historical data to perform real-time traffic congestion prediction and alleviation, as well as real-time accurate travel time prediction?

# History of CMU in Silicon Valley

Epoch 1: 2002 – 2008 (School of Computer Science)

- Full-time & Part-time MS degrees in SE & SM

Epoch 2: 2008 – 2014 (College of Engineering)

- MS degrees in SE & SM; **INI** MS bi-costal degrees; **ECE** MS & PhD degrees

**Epoch 3: 2014 – 2020** (College of Engineering)

- **Electrical & Computer Engineering (ECE):** MS, MS-SE, & PhD
- **Information Networking Institute (INI):** MSIT-IS, MSIT-MOB, MSIT-SM
- **Integrated Innovation Institute (III):** MS-SM, MS-TV

**Current CMU-SV Total: ~300 MS; ~40 PhD; ~20 Faculty; ~20 Staff**

# HUMANS Industry Partnership Program

## ➤ Membership categories:

- ✓ **Founding Members:** \$500K/year (4-year commitment)
- ✓ **Associate Members:** \$250K/year (2-year commitment)

## ➤ Represented industries:

- ✓ Telecomm Infrastructure
- ✓ Wireless Carrier
- ✓ Mobile Hardware
- ✓ Cloud Infrastructure
- ✓ Transportation Systems

## ➤ Membership benefits:

1. Direct access to faculty and PhD students (including internships & consulting)
2. Access to pre-published research results (quarterly updates & annual reviews)
3. Access to prototype software and tools (internal evaluation and commercialization)
4. Non-exclusive royalty-free licenses to all IP generated through this initiative
